AMENDMENTS TO THE CLAIMS

The complete listing of claims below replaces all prior versions.

- 1 (Previously Amended). A process for creating a porous polymeric body of desired shape, comprising the steps of:
 - a. selecting a polymer;
 - b. identifying a first solvent that is capable of substantially dissolving a solid form of the polymer;
 - c. identifying a second solvent that does not substantially dissolve the polymer in solid form, but instead merely swells the solid polymer;
 - d. providing at least sufficient first solvent to said polymer as to substantially dissolve the polymer in the first solvent to form a solution;
 - e. adding a quantity of the second solvent to the solution, whereupon the solution begins to gel;
 - f. continuing the adding of the second solvent until a viscosity of the gel increases to a point where the gel is suitable for shape-forming;
 - g. shape-forming the gel; and
 - h. removing the first and second solvents from the gel.
- 2 (Original). The process of claim 1, wherein forming of the polymer gel comprises spreading the gel onto an open smooth or textured surface.
- 3 (Original). The process of claim 1, wherein forming of the polymer gel comprises injecting the gel into a mold.
- 4 (Original). The process of claim 1, wherein forming of the polymer gel comprises spreading or injecting the gel over a three-dimensional object, and removing the three-dimensional object after removing the first and second solvent from the gel.
- 5 (Original). The process of claim 1, wherein forming of the polymer gel involves forcing a three-dimensional object into a volume of the gel, and removing the three-dimensional object after removing the first and second solvent from the gel.
- 6 (Original). The process of claim 1, wherein a biologically active agent is mixed with the polymer and first solvent prior to addition of the second solvent.
- 7 (Original). The process of claim 1, wherein a biologically active agent is mixed with the second solvent prior to addition to the first solvent/polymer solution.

- 8 (Original). The process of claim 1, wherein a biologically active agent is mixed with the gel prior to removal of the first and second solvents.
- 9 (Original). The process of claim 1, wherein a biologically active agent is incorporated within the pores of the polymeric body after removal of the first and second solvent.
- 10 (Original). The process of any of claims 6, 7, 8 or 9, wherein the biologically active agent is selected from one or more of the following: physiologically acceptable drugs, surfactants, ceramics, hydroxyapatites, tricalciumphosphates, antithrombogenic agents, antibiotics, biologic modifiers, glycosaminoglycans, proteins, hormones, antigens, viruses, cells or cellular components.
- 11 (Original). The process of claim 1, wherein the gel is placed in contact with a separate body, after which the first and second solvent are removed, leaving the porous polymer mechanically bound to the body.
- 12 (Original). The process of claim 1, wherein the polymer comprises a polyurethane.
- 13 (Previously amended). The process of claim 12, wherein the first solvent comprises at least one solvent selected from the group comprising dimethyl acetimide, n-methyl pyrrolidinone and tetrahydrofuran.
- 14 (Original). The process of claim 12, wherein the first solvent comprises tetrahydrofuran, and the second solvent comprises at least one solvent selected from the group comprising p-dioxane, dimethyl sulfoxide and o-xylene.
- 15 (Previously Amended). A process for creating a composite body comprising a porous polymeric body using a gel enhanced phase separation technique, the process comprising the steps of:
 - a. substantially dissolving a selected polymer in a suitable first organic solvent to form a solution:
 - b. adding a suitable second solvent to the solution that causes the solvent/polymer solution to thicken into a gel;
 - c. placing the gel in contact with at least one other material; and
 - d. removing the first and second solvent, thereby leaving a porous polymer and the at least one other material, wherein said porous polymer and said at least one other material are mechanically bound to each other.
- 16 (Original). The process of claim 15, wherein the other material is biodegradable.
- 17 (Original). The process of claim 15, wherein the other material provides reinforcement to the porous polymer.

- 18 (Original). The process of claim 17, wherein the other material is in the form of reinforcing threads.
- 19 (Original). The process of claim 15, wherein the other material is in the form of reinforcing rings.
- 20 (Currently Amended). The process of claim 15, wherein the porous polymeric body comprises a prosthesis, and the other material aids in attaching the porous polymer prosthesis to host tissue.
- 21 (Original). The process of claim 16, wherein the other material is in the form of a suture.
- 22 (Original). The process of claim 16, wherein the other material is in the form of a tack.
- 23 (Original). The process of claim 15, wherein the other material is a biologically active agent.
- 24 (Original). The process of claim 23, wherein the biologically active agent is selected from one or more of the following: physiologically acceptable drugs, surfactants, ceramics, hydroxyapatites, tricalciumphosphates, antithrombogenic agents, antibiotics, biologic modifiers, glycosaminoglycans, proteins, hormones, antigens, viruses, cells or cellular components.
- 25 (Original). The process of claim 15, wherein the composite body is a component of a larger body.
- 26 (Previously Added). The process of claim 15, wherein the selected polymer comprises a polyurethane.
- 27 (Previously Added). The process of claim 26, wherein the first solvent comprises at least one solvent selected from the group comprising dimethyl acetimide, n-methyl pyrrolidinone and tetrahydrofuran.
- 28 (Previously Added). The process of claim 26, wherein the first solvent comprises tetrahydrofuran, and the second solvent comprises at least one solvent selected from the group comprising p-dioxane, dimethyl sulfoxide and o-xylene.
- 29 (Previously Added). The process of claim 1, wherein the polymer comprises at least one polymer selected from the group consisting of polyureas, polyethylenes, polyesters and fluoropolymers.

- 30 (Previously Added). The method of claim 1, wherein said first solvent comprises an organic solvent selected from the group consisting of acetone, chloroform, p-dioxane, methylene chloride, n,n-dimethyl acetimide, dimethyl sulfoxide, 1-methyl-2-pyrrolidone, tetrahydrofuran, toluene, m-xylene, o-xylene, and methyl-ethyl-ketone.
- 31 (Previously Added). The method of claim 1, wherein said second solvent comprises an organic solvent selected from the group consisting of acetone, chloroform, p-dioxane, methylene chloride, n,n-dimethyl acetimide, dimethyl sulfoxide, 1-methyl-2-pyrrolidone, tetrahydrofuran, toluene, m-xylene, o-xylene, and methyl-ethyl-ketone.
- 32 (Previously Added). A process for creating a porous polyurethane body, comprising the steps of:
 - a. dissolving a solid polyurethane polymer in a suitable first solvent to create a solvent/polyurethane solution;
 - b. adding a suitable second solvent to the solution, thereby causing the solvent/polyurethane solution to thicken into a gel;
 - c. forming the gel into a desired shape; and
 - d. removing the first and second solvent from the gel, thereby leaving behind a shaped, porous polyurethane body.
